-Part 1: The Pooling Problem

Introduction

# The Pooling Problem: Network Flow on Tripartite Graph

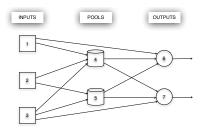

- Network flow problem on a tripartite directed graph, with three type of node: *Input* Nodes (I), *Pool* Nodes (L), *Output* Nodes (J).
- Send flow from input nodes via pool nodes to output nodes.
- Each of the arcs and nodes have capacities of flow.

Part 1: The Pooling Problem

Introduction

#### The Pooling Problem: Other Constraints

 Raw material has specifications (like sulphur, carbon, etc.).

Part 1: The Pooling Problem

Introduction

#### The Pooling Problem: Other Constraints

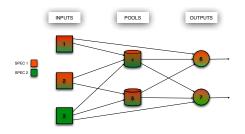

- Raw material has specifications (like sulphur, carbon, etc.).
- Raw material gets mixed at the pool producing new specification level at pools.

< ロ > < 同 > < 回 > < 回 >

-Part 1: The Pooling Problem

Introduction

#### The Pooling Problem: Other Constraints

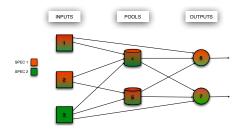

- Raw material has specifications (like sulphur, carbon, etc.).
- Raw material gets mixed at the pool producing new specification level at pools.
- The material gets further mixed at the output nodes.

-Part 1: The Pooling Problem

Introduction

#### The Pooling Problem: Other Constraints

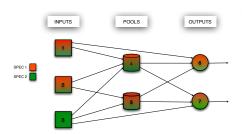

- Raw material has specifications (like sulphur, carbon, etc.).
- Raw material gets mixed at the pool producing new specification level at pools.
- The material gets further mixed at the output nodes.
- The output node has required levels for each specification.

Part 1: The Pooling Problem

Introduction

### **Tracking Specification**

#### Data:

 λ<sub>i</sub><sup>k</sup>: The value of specification k at input node i.

3

Part 1: The Pooling Problem

Introduction

### **Tracking Specification**

#### Data:

 λ<sub>i</sub><sup>k</sup>: The value of specification k at input node i.

#### Variable:

- *p*<sup>k</sup><sub>l</sub>: The value of specification k at node l
- ► y<sub>ab</sub>: Flow along the arc (ab).

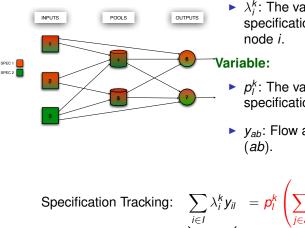

(日)

э

Part 1: The Pooling Problem

Introduction

### Tracking Specification

#### Data:

- $\triangleright$   $\lambda_i^k$ : The value of specification k at input
- $\triangleright$   $p_l^k$ : The value of specification k at node l
- y<sub>ab</sub>: Flow along the arc

Specification Tracking:  $\sum_{i \in I} \lambda_i^k y_{il} = p_i^k \left( \sum_{i \in J} y_{ij} \right)$ Inflow of Spec k Out flow of Spec k 5

Part 1: The Pooling Problem

Introduction

#### The pooling problem: 'P' formulation

 $\max \quad \sum_{ij \in \mathcal{A}} w_{ij} y_{ij} \quad (\text{Maximize profit due to flow})$ 

Part 1: The Pooling Problem

Introduction

### The pooling problem: 'P' formulation

 $\max \quad \sum_{ij \in \mathcal{A}} w_{ij} y_{ij} \quad \text{(Maximize profit due to flow)}$ 

Subject To:

- 1. Node and arc capacities.
- 2. Total flow balance at each node.
- 3. Specification balance at each pool.

$$\sum_{i \in I} \lambda_i^k y_{il} = p_l^k \left( \sum_{j \in J} y_{lj} \right)$$

4. Bounds on  $p_j^k$  for all out put nodes *j* and specification *k*.

Part 1: The Pooling Problem

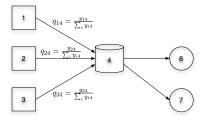

Introduction

### **PQ Model**

#### New Variable:

*q<sub>il</sub>* : fraction of flow to *I* from *i* ∈ *I* 

$$\sum_{i\in I} q_{il} = 1, q_{il} \ge 0, i \in I.$$

Part 1: The Pooling Problem

Introduction

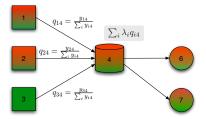

### **PQ Model**

#### **New Variable:**

*q<sub>il</sub>* : fraction of flow to *I* from *i* ∈ *I* 

$$\sum_{i\in I} q_{il} = 1, q_{il} \ge 0, i \in I.$$

• 
$$p_l^k = \sum_{i \in I} \lambda_i^k q_{il}$$

Part 1: The Pooling Problem

Introduction

### PQ Model

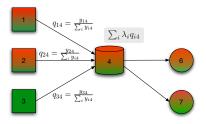

#### New Variable:

•  $q_{il}$  : fraction of flow to *l* from  $i \in I$ 

$$\sum_{i\in I} q_{il} = 1, q_{il} \ge 0, i \in I.$$

• 
$$p_l^k = \sum_{i \in I} \lambda_i^k q_{il}$$

 v<sub>iij</sub> : flow from input node i to output node j via pool node l.

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Part 1: The Pooling Problem

Introduction

### PQ Model

#### New Variable:

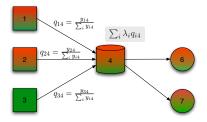

•  $q_{il}$  : fraction of flow to *l* from  $i \in I$ 

$$\sum_{i\in I} q_{il} = 1, q_{il} \ge 0, i \in I.$$

• 
$$p_l^k = \sum_{i \in I} \lambda_i^k q_{il}$$

 v<sub>iij</sub> : flow from input node i to output node j via pool node l.

• 
$$v_{ilj} = q_{il} y_{lj}$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Part 1: The Pooling Problem

Introduction

#### PQ Model Complete

$$\begin{array}{ll} \max & \sum_{i \in I, j \in J} w_{ij} y_{ij} + \sum_{i \in I, l \in L, j \in J} (w_{il} + w_{lj}) v_{ilj} \\ \text{s.t.} & \textbf{v}_{ilj} = q_{il} y_{lj} \; \forall i \in I, l \in L, j \in J \\ & \sum_{i \in I} q_{il} = 1 \; \forall l \in L \\ & a_j^k \left( \sum_{i \in I} y_{ij} + \sum_{l \in L} y_{lj} \right) \leq \sum_{i \in I} \lambda_i^k y_{ij} + \sum_{i \in I, l \in L} \lambda_i^k v_{ilj} \leq b_j^k \left( \sum_{i \in I} y_{ij} + \sum_{l \in L} y_{lj} \right) \\ & \text{Capacity constraints} \\ & \text{All variables are non-negative} \end{array}$$

$$\sum_{i \in I} \mathbf{v}_{i|j} = \mathbf{y}_{ij} \ \forall l \in L, j \in J$$
$$\sum_{j \in J} \mathbf{v}_{i|j} \le \mathbf{c}_l \mathbf{q}_{il} \ \forall i \in I, l \in L.$$

₹ *\_\_\_\_* � � � �

11

Part 1: The Pooling Problem

- Restriction

## Using Mixed Integer Linear Programming to Construction Restriction

$$\boldsymbol{S} := \{ (\boldsymbol{x}, \boldsymbol{y}, \boldsymbol{w}) \in \mathbb{R}^3 \mid \boldsymbol{w} = \boldsymbol{x} \boldsymbol{y}, \ \boldsymbol{x}_l \leq \boldsymbol{x} \leq \boldsymbol{x}_u, \ \boldsymbol{y}_l \leq \boldsymbol{y} \leq \boldsymbol{y}_u \}.$$

1. Restrictions typically obtained by restricting a subset of variables, say *y*, to take values in a pre-determined finite set.

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三 ����

Part 1: The Pooling Problem

- Restriction

# Using Mixed Integer Linear Programming to Construction Restriction

$$\boldsymbol{S} := \{ (\boldsymbol{x}, \boldsymbol{y}, \boldsymbol{w}) \in \mathbb{R}^3 \mid \boldsymbol{w} = \boldsymbol{x} \boldsymbol{y}, \ \boldsymbol{x}_l \leq \boldsymbol{x} \leq \boldsymbol{x}_u, \ \boldsymbol{y}_l \leq \boldsymbol{y} \leq \boldsymbol{y}_u \}.$$

- 1. Restrictions typically obtained by restricting a subset of variables, say *y*, to take values in a pre-determined finite set.
- 2. This restriction can be modeled using extra 0/1 variables and unary or binary expansion models.
- 3. Pham et al. (2009), Alfaki et al. (2011), Gupte et al.(2012) used for pooling problem with some success.

Why do these MILP relaxations work so well?

Theorem Let n denote the number of output nodes.

Part 2: Main Results

#### Main Results - Relaxations

Why do these MILP relaxations work so well?

#### Theorem

Let n denote the number of output nodes. Let  $z^*$  denote the optimal solution of pooling problem.

Part 2: Main Results

#### Main Results - Relaxations

Why do these MILP relaxations work so well?

#### Theorem

Let n denote the number of output nodes. Let  $z^*$  denote the optimal solution of pooling problem.

 Bound: For any pwl MILP relaxation P, let z<sup>P</sup> be the optimal value of the MILP.

Part 2: Main Results

## Main Results - Relaxations

Why do these MILP relaxations work so well?

#### Theorem

Let n denote the number of output nodes. Let  $z^*$  denote the optimal solution of pooling problem.

 Bound: For any pwl MILP relaxation P, let z<sup>P</sup> be the optimal value of the MILP. Then

 $z^* \leq z^{\mathcal{P}} \leq nz^*.$ 

Part 2: Main Results

#### Main Results - Relaxations

Why do these MILP relaxations work so well?

#### Theorem

Let n denote the number of output nodes. Let  $z^*$  denote the optimal solution of pooling problem.

 Bound: For any pwl MILP relaxation P, let z<sup>P</sup> be the optimal value of the MILP. Then

$$z^* \leq z^{\mathcal{P}} \leq nz^*.$$

 Quality of analysis: Suppose we choose a pwl MILP relaxation *P*. Then for any ε > 0, there exists an instance of the pooling problem with

$$z^{\mathcal{P}} \geq (n-\epsilon)z^*.$$

# Main Results - Computational Complexity

**Corollary** There exists a polynomial-time algorithm that produces a feasible solution with objective function value  $z^{\mathcal{A}}$  that satisfies  $z^{\mathcal{A}} \geq \frac{z^*}{n}$ .

# Main Results - Computational Complexity

#### Corollary

There exists a polynomial-time algorithm that produces a feasible solution with objective function value  $z^{\mathcal{A}}$  that satisfies  $z^{\mathcal{A}} \geq \frac{z^*}{n}$ .

1. Note that the dimension of the pooling problem is governed by |I| (number of input nodes), |L| (number of pools), n := |J| (number of output nodes), |K| (number of specs.).

# Main Results - Computational Complexity

#### Corollary

There exists a polynomial-time algorithm that produces a feasible solution with objective function value  $z^{\mathcal{A}}$  that satisfies  $z^{\mathcal{A}} \geq \frac{z^*}{n}$ .

1. Note that the dimension of the pooling problem is governed by |I| (number of input nodes), |L| (number of pools), n := |J| (number of output nodes), |K| (number of specs.).

# Main Results - Computational Complexity

#### Corollary

There exists a polynomial-time algorithm that produces a feasible solution with objective function value  $z^{\mathcal{A}}$  that satisfies  $z^{\mathcal{A}} \geq \frac{z^*}{n}$ .

- 1. Note that the dimension of the pooling problem is governed by |I| (number of input nodes), |L| (number of pools), n := |J| (number of output nodes), |K| (number of specs.).
- 2. But a factor of 'n' is still very bad, ...

#### Proposition

If there exists a polynomial-time approximation algorithm with guarantee  $z^{\mathcal{A}} \geq \frac{z^*}{n-\epsilon}$  for any  $\epsilon > 0$  for the pooling problem, then any problem in NP has randomized polynomial time algorithm.

Part 2: Main Results

#### Main results - Computational

1. Actually the 'approximation algorithm' is a **"rather silly** algorithm".

Part 2: Main Results

## Main results - Computational

- 1. Actually the 'approximation algorithm' is a **"rather silly** algorithm".
- 2. We generalize the key ideas behind the *n*-approximation algorithm to construct a MILP s.t.
  - 2.1 MILP's feasible region is a restriction of the pooling problem.
  - 2.2 All solution produced by the approximation algorithm belong to the MILP  $\Rightarrow$  MILP produces solutions within a factor of *n*.

Part 2: Main Results

## Main results - Computational

- 1. Actually the 'approximation algorithm' is a **"rather silly** algorithm".
- 2. We generalize the key ideas behind the *n*-approximation algorithm to construct a MILP s.t.
  - 2.1 MILP's feasible region is a restriction of the pooling problem.
  - 2.2 All solution produced by the approximation algorithm belong to the MILP  $\Rightarrow$  MILP produces solutions within a factor of *n*.
- 3. The MILP produces good results in short time. In particular, for a number of problems in the literature, we have **found the best known solutions.**

# 3 Quality of MILP relaxation

11日

Part 3: Quality of MILP Relaxation

## Quality of dual bound

#### Proposition

Let n denote the number of output nodes. Let  $z^*$  denote the optimal solution of pooling problem. For any pwl MILP relaxation  $\mathcal{P}$ , let  $z^{\mathcal{P}}$  be the optimal value of the MILP. Then

 $z^* \leq z^{\mathcal{P}} \leq nz^*$ .

Part 3: Quality of MILP Relaxation

#### High level proof technique

1. We construct a general relaxation  $\mathcal{R}$  of the pooling problem, such that  $\mathcal{R} \supseteq \mathcal{P}$ , i.e.  $\mathcal{R}$  is a relaxation of  $\mathcal{P}$ , for all  $\mathcal{P}$ .

- 1. We construct a general relaxation  $\mathcal{R}$  of the pooling problem, such that  $\mathcal{R} \supseteq \mathcal{P}$ , i.e.  $\mathcal{R}$  is a relaxation of  $\mathcal{P}$ , for all  $\mathcal{P}$ .
- 2. Let  $z^{\mathcal{R}}$  be the optimal solution of  $\mathcal{R}$ :

 $z^{\mathcal{P}} \leq z^{\mathcal{R}}$ 

3. We will show that

 $z^{\mathcal{R}} \leq n\tilde{z},$ 

where  $\tilde{z}$  is objective function value of a feasible solution of the pooling problem.

Part 3: Quality of MILP Relaxation

#### High level proof technique

- 1. We construct a general relaxation  $\mathcal{R}$  of the pooling problem, such that  $\mathcal{R} \supseteq \mathcal{P}$ , i.e.  $\mathcal{R}$  is a relaxation of  $\mathcal{P}$ , for all  $\mathcal{P}$ .
- 2. Let  $z^{\mathcal{R}}$  be the optimal solution of  $\mathcal{R}$ :

 $z^{\mathcal{P}} \leq z^{\mathcal{R}}$ 

3. We will show that

 $z^{\mathcal{R}} \leq n\tilde{z},$ 

where  $\tilde{z}$  is objective function value of a feasible solution of the pooling problem.

4. Therefore,  $\tilde{z} \leq z^*$ 

Part 3: Quality of MILP Relaxation

## High level proof technique

- 1. We construct a general relaxation  $\mathcal{R}$  of the pooling problem, such that  $\mathcal{R} \supseteq \mathcal{P}$ , i.e.  $\mathcal{R}$  is a relaxation of  $\mathcal{P}$ , for all  $\mathcal{P}$ .
- 2. Let  $z^{\mathcal{R}}$  be the optimal solution of  $\mathcal{R}$ :

 $z^{\mathcal{P}} \leq z^{\mathcal{R}}$ 

3. We will show that

 $z^{\mathcal{R}} \leq n\tilde{z},$ 

where  $\tilde{z}$  is objective function value of a feasible solution of the pooling problem.

- 4. Therefore,  $\tilde{z} \leq z^*$
- 5. Combining we obtain:  $z^{\mathcal{P}} \leq z^{\mathcal{R}} \leq n\tilde{z} \leq nz^*$ , i.e.,  $|z^{\mathcal{P}} \leq nz^*|$

Part 3: Quality of MILP Relaxation

## High level proof technique

- 1. We construct a general relaxation  $\mathcal{R}$  of the pooling problem, such that  $\mathcal{R} \supseteq \mathcal{P}$ , i.e.  $\mathcal{R}$  is a relaxation of  $\mathcal{P}$  as well.
- 2. Let  $z^{\mathcal{R}}$  be the optimal objective function value of  $\mathcal{R}$ :

$$z^{\mathcal{P}} \leq z^{\mathcal{R}}$$

3. We will show that

 $z^{\mathcal{R}} \leq n\tilde{z},$ 

where  $\tilde{z}$  is objective function value of a feasible solution of the pooling problem.

- 4. Therefore,  $\tilde{z} \leq z^*$
- 5. Combining we obtain:  $z^{\mathcal{P}} \leq z^{\mathcal{R}} \leq n\tilde{z} \leq nz^*$ , i.e.,  $z^{\mathcal{P}} \leq nz^*$

## **Final details**

# **Lemma** $(\bar{y}, \bar{v}, \bar{q})$ is a valid solution to the pooling problem.

## Proposition

 $z^{\mathcal{R}} \leq n\tilde{z}$ 

#### Proof:

- 1. (y, v) is optimal solution of *IPOP*
- 2.  $(\bar{y}, \bar{v}, \bar{q})$  is a valid solution for pooling problem.

Part 3: Quality of MILP Relaxation

## **Final details**

# **Lemma** $(\bar{y}, \bar{v}, \bar{q})$ is a valid solution to the pooling problem.

### Proposition

 $z^{\mathcal{R}} \leq n\tilde{z}$ 

#### Proof:

- 1. (y, v) is optimal solution of *IPOP*
- 2.  $(\bar{y}, \bar{v}, \bar{q})$  is a valid solution for pooling problem.
- 3. Because  $j^*$  was picked greedily, we have that  $n(\text{Obj. value}(\bar{y}, \bar{v}, \bar{q})) \ge (\text{Obj. value}(y, v))$ .

Part 3: Quality of MILP Relaxation

Analysis is tight

#### Proposition (Quality of analysis)

Suppose we choose a pwl MILP relaxation  $\mathcal{P}$ . Then for any  $\epsilon > 0$ , there exists an instance of the pooling problem with

 $z^{\mathcal{P}} \geq (n-\epsilon)z^*.$ 

Part 3: Quality of MILP Relaxation

## Analysis is tight : High level idea

Construct a pooling problem with:

1. 2 input nodes, 1 pool node, *n* out put nodes, 2 specs, no direct arcs between input and output nodes.

Part 3: Quality of MILP Relaxation

# Analysis is tight : High level idea

Construct a pooling problem with:

- 1. 2 input nodes, 1 pool node, *n* out put nodes, 2 specs, no direct arcs between input and output nodes.
- 2. Each output node has a capacity of 1.

・ロッ ・雪 ・ ・ ヨ ・ ・

### Approximation preserving reduction from Stable Set Theorem (Hardness to Approximate Max Stable Set (Håstad))

In a graph with n nodes, the max stable set problem cannot be approximated in polynomial time within a factor  $n^{1-\epsilon}$ , for any constant  $\epsilon > 0$ , unless any problem in NP can be solved in probabilistic polynomial time.

< ロ > < 同 > < 回 > < 回 > .

### Approximation preserving reduction from Stable Set Theorem (Hardness to Approximate Max Stable Set (Håstad))

In a graph with n nodes, the max stable set problem cannot be approximated in polynomial time within a factor  $n^{1-\epsilon}$ , for any constant  $\epsilon > 0$ , unless any problem in NP can be solved in probabilistic polynomial time.

# Proposition (Approximation Factor Preserving Reduction from Stable Set Problem)

Given a simple graph with n vertices, there exists an instance of the pooling problem with n output nodes and of size polynomial in the size of the input graph such that

< 日 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

### Approximation preserving reduction from Stable Set Theorem (Hardness to Approximate Max Stable Set (Håstad))

In a graph with n nodes, the max stable set problem cannot be approximated in polynomial time within a factor  $n^{1-\epsilon}$ , for any constant  $\epsilon > 0$ , unless any problem in NP can be solved in probabilistic polynomial time.

# Proposition (Approximation Factor Preserving Reduction from Stable Set Problem)

Given a simple graph with n vertices, there exists an instance of the pooling problem with n output nodes and of size polynomial in the size of the input graph such that

1. The size of the maximum stable set of the input graph is less than or equal to the optimal objective function value of the instance of the pooling problem.

### Approximation preserving reduction from Stable Set Theorem (Hardness to Approximate Max Stable Set (Håstad))

In a graph with n nodes, the max stable set problem cannot be approximated in polynomial time within a factor  $n^{1-\epsilon}$ , for any constant  $\epsilon > 0$ , unless any problem in NP can be solved in probabilistic polynomial time.

# Proposition (Approximation Factor Preserving Reduction from Stable Set Problem)

Given a simple graph with n vertices, there exists an instance of the pooling problem with n output nodes and of size polynomial in the size of the input graph such that

- 1. The size of the maximum stable set of the input graph is less than or equal to the optimal objective function value of the instance of the pooling problem.
- Given any feasible solution for the instance of the pooling problem with objective function value t, it is possible to construct a stable set in the input graph of cardinality greater than or equal to t in polynomial time.

Part 5: A New MILP Restriction

### Discussion

1. For 19 out of the 20 Alfaki et al. instances, MILP heuristic produces the best known results.

Part 5: A New MILP Restriction

### Discussion

1. For 19 out of the 20 Alfaki et al. instances, MILP heuristic produces the best known results.

**Open Problems:** 

1. The performance of the MILP heuristic is surprising. Can we better explain this?

Part 5: A New MILP Restriction

### Discussion

1. For 19 out of the 20 Alfaki et al. instances, MILP heuristic produces the best known results.

**Open Problems:** 

- 1. The performance of the MILP heuristic is surprising. Can we better explain this?
- 2. For a fixed value of out degree of the pool nodes, what is the complexity status of this problem?

Part 5: A New MILP Restriction

# Discussion

1. For 19 out of the 20 Alfaki et al. instances, MILP heuristic produces the best known results.

**Open Problems:** 

- 1. The performance of the MILP heuristic is surprising. Can we better explain this?
- 2. For a fixed value of out degree of the pool nodes, what is the complexity status of this problem?
- 3. If we fix the number of specifications, what is the complexity of the problem?
- 4. Is it possible to obtain a better guarantee than *n* (*n* is the number of output nodes), by using some other MILP restrictions of the pooling problem?

Part 5: A New MILP Restriction
