$$\begin{array}{ll} \min & \langle \boldsymbol{C}, \boldsymbol{X} \rangle \\ \text{s.t.} & \langle \boldsymbol{A}^{i}, \boldsymbol{X} \rangle \leq \boldsymbol{b}_{i} \quad \forall i \in \{1, \dots, m\} \\ & \boldsymbol{X} \in \mathcal{S}^{n}_{+}, \end{array}$$
 (SDP)

$$\begin{array}{ll} \min & \langle C, X \rangle \\ \text{s.t.} & \langle A^i, X \rangle \leq b_i \ \forall i \in \{1, \dots, m\} \\ & \text{selected } k \times k \text{ principal submatrices of } X \in \mathcal{S}_+^k. \end{array}$$

Blekherman, Dey, Molinaro, Sun

Introduction

Main result

Proof sketch

A relaxation: Sparse SDP

$$\begin{array}{ll} \min & \langle \boldsymbol{C}, \boldsymbol{X} \rangle \\ \text{s.t.} & \langle \boldsymbol{A}^{i}, \boldsymbol{X} \rangle \leq \boldsymbol{b}_{i} \quad \forall i \in \{1, \dots, m\} \\ & \boldsymbol{X} \in \mathcal{S}^{n}_{+}, \end{array}$$
 (SDP)

$$\begin{array}{ll} \min & \langle \boldsymbol{C}, \boldsymbol{X} \rangle \\ \text{s.t.} & \langle \boldsymbol{A}^i, \boldsymbol{X} \rangle \leq \boldsymbol{b}_i \; \forall i \in \{1, \ldots, m\} & \text{(Sparse SDP)} \\ & \text{selected } k \times k \; \text{principal submatrices of } \boldsymbol{X} \in \mathcal{S}_+^k. \end{array}$$

We can enforce PSD constraints by iteratively separating linear constraints. Enforcing PSD-ness on smaller k × k principal submatrix leads to linear constraints that are sparser, an important property leveraged by linear programming solvers that greatly improve their efficiency.

Theorem Let $2 \le k \le n - 1$. Consider $\varepsilon, \delta > 0$ and let

$$m = 24\left(\frac{n^2}{\varepsilon^2}\ln\frac{n}{\delta}\right).$$

Let $\mathcal{I} = (I_1, ..., I_m)$ be a sequence of random *k*-sets independently uniformly sampled from $\binom{[n]}{k}$, and define $S_{\mathcal{I}}$ as the set of matrices satisfying the PSD constraints for the principal submatrices indexed by the I_i 's, namely

$$S_{\mathcal{I}} := \{ \boldsymbol{M} \in \mathbb{R}^{n \times n} : \boldsymbol{M}_{l_i} \succeq \mathbf{0}, \forall i \in [m] \}.$$

Then with probability at least $1 - \delta$ we have

$$\overline{\operatorname{dist}}_{F}(\mathcal{S}_{\mathcal{I}},\mathcal{S}^{n}_{+}) \leq (1+\varepsilon)\frac{n-k}{n+k-2}.$$

3 Proof sketch

Proof of upper bound 2

- ► Using Cauchy's Interlace Theorem for eigenvalues of symmetric matrices, we obtain that every matrix in S^{n,k} has at most n - k negative eigenvalues.
- Since the PSD cone consists of symmetric matrices with non-negative eigenvalues, the distance from a unit-norm matrix *M* ∈ S^{n,k} to Sⁿ₊ is upper bounded by

(absolute value of most negative eigenvalue of M)× $\sqrt{n-k}$.

So we need to upper bound absolute value of most negative eigenvalue of M for M ∈ S^{n,k} and ||M||_F = 1.
