Description:

An overview of demand estimation and revenue management, also called pricing and revenue optimization, including

- statistical techniques for estimating and forecasting the level and characteristics of demand;
- revenue-based inventory control methods;
- static and dynamic pricing decisions;
- auctions;
- optimization approaches to revenue management, both exact and approximate.

Objectives:

The objectives are to

- develop an understanding of the benefits and costs of systematic quantitative revenue management, and the process by which such revenue management can be implemented;
- develop a familiarity with demand modeling, forecasting, and revenue management techniques;
- understand the strengths and weaknesses of the available statistical tools for demand forecasting;
- develop insight into the formulation and solution of pricing and revenue optimization problems.

Prerequisites:

A basic knowledge of probability and statistics. Students should also know how to use the statistical and optimization tools in a spreadsheet.
